

# Use-Case Flow

## UC-02 — Ingest Webhook Event

| STUDENT      | SRN           | SECTION |
|--------------|---------------|---------|
| VRUSHANT K P | PES1UG24CS542 | I       |

|               |                                                                                                                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRECONDITIONS | <div>1. The webhook gateway is operational and accessible.</div> <div>2. The webhook integration is registered with a valid destination endpoint.</div> <div>3. The third-party provider has a valid event to send.</div> |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                |                                                                                                                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POSTCONDITIONS | <div>On success, the payload is stored, forwarded to the configured target, and the delivery outcome is recorded.</div> <div>On failure, failed attempts are recorded; the webhook is retried and, after permitted retries are exhausted, placed in the dead-letter queue.</div> |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Main Success Scenario

|    |                                                                                                             |
|----|-------------------------------------------------------------------------------------------------------------|
| 01 | Third-Party Webhook Provider sends a webhook event.                                                         |
| 02 | The gateway receives the request.                                                                           |
| 03 | The system identifies the webhook integration.                                                              |
| 04 | The system creates a delivery record containing the payload, timestamp, integration identifier, and status. |
| 05 | The system forwards the payload to the configured destination.                                              |
| 06 | The Internal Target Service receives the webhook successfully.                                              |
| 07 | The system records the delivery as successful.                                                              |
| 08 | The system completes processing.                                                                            |

### Alternate Flow — Target Service Unavailable

|    |                                                                                        |
|----|----------------------------------------------------------------------------------------|
| 01 | The destination service fails to receive the webhook.                                  |
| 02 | The system records the failed delivery attempt.                                        |
| 03 | The system schedules another delivery using the retry policy.                          |
| 04 | The system retries after the applicable delay.                                         |
| 05 | The system continues retrying while permitted attempts remain.                         |
| 06 | If all permitted attempts fail, the system moves the webhook to the dead-letter queue. |
| 07 | The system records the final failure status.                                           |
